

Application for Graduate Cyber Security Analyst

Dear BUUK Infrastructure Recruitment Team,

I am applying for the Graduate Cyber Security Analyst role because it offers the structured start I am looking for: hands-on exposure to operational security alongside information governance, cyber risk and data protection. BUUK Infrastructure supports utility services that customers and communities rely on every day, which is exactly the kind of setting where careful security and privacy work has a direct purpose.

My MSc in Information Security from Royal Holloway, awarded with Merit, gave me a foundation in ISO 27001-focused security management, critical infrastructure security, digital forensics and network security, supported by CompTIA Security+ and ISC2 Certified in Cybersecurity. That grounding would help me organise evidence, understand what a control is meant to achieve and keep risk and compliance information clear for the people who have to act on it, while I learn BUUK's standards, processes and systems.

My projects have given me practice in evidence-led security work. InboxDefender is a phishing-analysis prototype I designed to highlight suspicious email indicators and support manual triage, keeping sensitive email data local and mapping findings to MITRE ATT&CK. AttackSurfaceIQ maps Windows error codes to their common causes so that system faults can be investigated consistently. These are personal projects rather than production tools, but they built the habits that support alert triage and incident documentation: recording what was checked, testing against legitimate as well as suspicious samples, and linking each finding to a practical next step.

In my IT Support Assistant role I am the first point of contact for IT issues, handling access requests through on-premises Active Directory and investigating suspicious emails for impersonation. That work taught me to confirm approval before granting access, to document what was changed and for how long, and to explain a security requirement to a colleague who is not technical. As Person in Charge at Co-op I run weekly risk assessments and daily compliance checks, log and escalate operational issues, and follow corrective actions through to completion. I would bring the same habit of tracking an issue to closure to your risk register and action-tracking work.

What I would offer BUUK is reliability, with the questions asked. I am organised, I treat confidential information carefully, and I am comfortable working with both technical and non-technical colleagues, asking for clarity rather than guessing. I am keen to learn your governance and assurance processes, to support vulnerability management, security reviews and third-party assessments as my capability grows, and to study towards the certifications you agree with me. I would value the chance to build a long-term career in security and information governance with your team.

Kind regards,

Mukund Didwania
